

Phase 7-Project Documentation Phase

Project title : Script-Controlled ACL - Restrict Record Access Based on Field Value

College Name: Government Arts and Science College, Manur.

College Code: MSU142

Department: B.SC Computer Science

Team ID: SWTID-2026-9029

TeamLeader: Subbulakshmi M NM ID: 727F7AC2ABD1D8C8DF6496517D478773

Team member: Arumuga Kani S NM id: 601EE17CA3AAD3AB4EA4C8F841A16DD1

Team member: Mariammal C NM id: BBE8324EB82C757A1054DE3C9951281A

Team member: Esakki Ganesh P NM id: A705CB2C71F3AF38AF2473EFB5AE7725

Team member: Akalya R NM id: B3F460E08A938D39C7F40868EA8EC1C6

7. Project Documentation Phase

The Project Documentation Phase is an important stage in the development of the Script-Controlled ACL – Restrict Record Access Based on Field Value project. In this phase, all the information related to the project is collected, organized, and presented in a clear and systematic manner.

The documentation explains the complete development process, starting from the identification of the problem and requirements to the final testing and results. It also provides technical details about how the ACL script works and how field-based record access is controlled.

7.1 Project Overview

The documentation provides an overview of the project and explains the purpose of using a Script-Controlled ACL for restricting record access.

7.2 Problem Description

The documentation describes the problem of unauthorized record access and explains why field-based access control is required to protect records.

7.3 Objectives

The main objectives of the project are documented, including:

- Controlling access to individual records.
- Restricting unauthorized users.
- Checking field values before granting access.
- Improving record-level security.
- Providing flexible access-control rules.

7.4 Requirement Specification

The required hardware, software, database, user roles, fields, and other system requirements are documented. Both functional and non-functional requirements are included.

7.5 System Design

The system design section explains the architecture and workflow of the project. Diagrams can be included to show the relationship between the user, record, field value, ACL script, and access decision.

7.6 ACL Configuration

The documentation explains how the ACL is configured and which records and fields are protected. The access conditions used by the ACL are also described.

7.7 Script Explanation

The purpose and working of the ACL script are explained step by step. The document describes how the script reads the field value, evaluates the condition, and produces an access decision.

7.8 Development Process

The different development activities are recorded, including:

- Creating records
- Creating fields
- Configuring users
- Defining access conditions
- Developing the ACL script
- Applying access restrictions
- Testing the implementation

7.9 Testing and Test Results

The test cases performed during development are documented. The expected and actual results are compared to verify that the system works correctly.

7.10 Screenshots

Important screenshots are added to provide visual evidence of the project. These may include:

- User login
- Record list
- Record details
- Field values
- ACL configuration
- Access granted result
- Access denied result

7.11 Security Features

The documentation explains how the system improves record security by preventing users from accessing records when the required field-value condition is not satisfied.

7.12 Advantages

The main advantages of the system are:

- Secure record-level access
- Flexible field-based restrictions
- Reduced unauthorized access
- Easy access-rule management
- Better control over sensitive records
- Improved system security

7.13 Limitations

Any limitations of the current implementation are documented. For example, access conditions depend on correctly configured fields, users, and ACL rules.

7.14 Future Enhancement

Possible future improvements can also be included, such as adding more complex access conditions, improving the user interface, introducing additional security rules, and supporting more detailed access reports.

7.15 Conclusion

The documentation concludes by summarizing how the Script-Controlled ACL provides controlled access to records based on field values. It confirms that the system is designed to provide secure and flexible record-level access control.

Documentation Flow

Project Overview → Problem → Objectives → Requirements → Design → ACL Configuration → Development → Testing → Screenshots → Security → Advantages → Limitations → Future Enhancement → Conclusion
